TITLE : VEHICLE PEDAL ATTACHING
STRUCTURE

ABSTRACT : PROBLEM TO BE SOLVED: To provide a vehicle pedal attaching structure with a lightweight and simple configuration allowing certain forward displacement of a pedal at the time of input of a load from the front of a vehicle.

SOLUTION: A pedal bracket 6 supporting a brake pedal 5 is provided over between a dash panel 2 displacing to rearward of a vehicle body at the time of input of a prescribed load or above and a cowl panel 3 behind the dash panel 2. The pedal bracket 6 is fixed to the dash panel 2 in the back-and-forth direction, and is fixed to the cowl panel 3 such that the pedal bracket 6 can displace in the back-and-forth direction by the action of the prescribed load or above. A reinforcing member 15 in a lower part of the dash panel 2 hardly deforming even at the time of input of the prescribed load or above from the front of the vehicle body and a rear part of the pedal bracket 6 are connected with a tension member 17. Thereby, when the dash panel 2 displaces rearward, the pedal bracket 6 turns obliquely rearward and downward to displace the pedal 7 forward.
